

III. CLAIM AMENDMENTS

1. (Currently Amended) A method for binding a program module in a terminal, in which one or several programs are running, and in which method subroutines are stored in said program modules, the program modules ~~are~~ is provided with a first tags, wherein to start binding, the program makes a call to a subroutine, and the call is supplemented with ~~the first call datatags~~ to select the program module for binding, in which the called subroutine is stored, wherein the first tags ~~are~~ is supplemented with a second tags, the call is also supplemented with ~~said~~ second call data, in connection with the binding, said first tags stored in the program modules ~~are~~ is compared with the first call datatags transmitted in the call, and the second tags ~~are~~ is compared with the second call data transmitted in the call, and the program module to be bound is selected to be the program module which matches with the first call datatags and the second call data transmitted in the call.
2. (Currently Amended) The method according to claim 1, wherein the second tags to be formed in the program modules contains a digital signature.
3. (Previously Presented) The method according to claim 2, wherein the second call data are supplemented with a public key, on the basis of which the digital signature of the second call data formed in the program module is verified.
4. (Currently Amended) The method according to claim 1, wherein the second tags to be formed in the program modules ~~are~~ is stored in an encrypted form.
5. (Currently Amended) The method according to claim 4, wherein the second call data are supplemented with a public key, on the basis of which the second tags formed in the program modules isare encrypted.

6. (Currently Amended) The method according to claim 1, in which the program modules—are is stored in a server communicating with a digital network, wherein the terminal used is a mobile terminal, and the binding of the program modules is performed at least partly by messages complying with the WAP protocol.

7. (Currently Amended) A terminal comprising means for binding a program module, in which program modules— contains at least one stored subroutines— and a first tags, and which terminal also comprises means for running programs, means for starting binding by performing in the program a call to a subroutine, the call being supplemented with a first call data to select that program module for binding in which the called subroutine is stored, wherein the program modules contains a stored second tags; the terminal also comprises means for adding second call data to the call, means for comparing said first tags— stored in the program modules with the first call data transmitted in the call, means for comparing the second tags with the second call data transmitted in the call, and means for selecting a program module to be bound on the basis of said comparison.

8. (Currently Amended) The terminal according to claim 7, wherein the second tags formed in the program modules contains a digital signature.

9. (Currently Amended) The terminal according to claim 8, wherein the second call data are supplemented with a public key, on the basis of which the digital signature of the second tags formed in the program module isare arranged to be verified.

10. (Currently Amended) The terminal according to claim 7, comprising means for binding a program modules— stored in a server communicating with the Internet network, wherein the terminal is a mobile terminal, and said mobile terminal comprises means for performing binding of the program modules at least partly by messages complying with the WAP protocol.

11. (New) A method in a terminal, in which one or several programs are running, said terminal comprising at least one program module, which is provided with a first tag and a second tag, and said at least one program module comprises at least one subroutine, wherein the method comprises:

making a call by the program to a subroutine;

supplementing the call with first call data to select a program module for binding among said at least one program module, in which the called subroutine is stored;

supplementing the call is also supplemented with second call data, in connection with the binding;

comparing said first tag stored in said at least one program module with the first call data transmitted in the call;

comparing the second tag with the second call data transmitted in the call; and

selecting the program module for binding to be the program module in which the first tag matches with the first call data and the second tag matches with the second call data.

12. (New) A terminal comprising:

a binding server for binding a program module, which program module contains at least one subroutine, a first tag and a second tag;

an element for running programs and configured to:

perform in the program a call to a subroutine,

supplementing the call with first call data to select that program module for binding in which the called subroutine is stored;

supplementing the call with second call data;

comparing said first tag stored in the program module with the first call data transmitted in the call;

comparing the second tag with the second call data transmitted in the call; and

09/739,941

RESPONSE TO OA MAILED July 14, 2006

selecting a program module to be bound on the basis of said comparison.
